GuestKit

Admin Basics

2026-08-29

Ports / access

Port / surface	Service
CLI / TUI	<code>guestkit</code> / <code>guestctl</code> on the operator host
8088	Optional zyvor-ui / Image Vault (GHCR compose eval)
8765	Guest agent proxy (<code>guestkit agent-proxy</code>) when used
KubeVirt API	zyvor-api guest / boot-inspect routes when integrated

Eval web (optional): `http://<host>:8088` — change default admin password immediately. Never publish lab IPs in customer docs.

Auth

- Local CLI needs disk/image access (often root for NBD/loop).
- SAML/OIDC on zyvor-api when the web/API surface is enabled.
- Agent channel: virtio-serial / QGA after inject.

Install sketch

```
cargo install questkit  
or: download the release binary for your OS  
qemu-img --version  
questkit version  
questkit doctor /path/to/disk.qcow2 --target kvm --explain
```

Optional UI: `docker compose -f deploy/docker-compose.ghcr.yml up -d` → open `:8088` .

Host needs: Linux + `qemu-utils` (`qemu-img`, `qemu-nbd`). For NBD: `modprobe nbd max_part=16` .
